– Troubleshooting & Support

1 Prerequisites

Before installing the ViaBill plugin, ensure the following:

Requirement	Details
WordPress version	5.0 or newer
WooCommerce version	3.3 or newer
PHP version	5.6 or newer (PHP 7.4+ recommended)
SSL	Must be installed and active on your checkout pages
ViaBill account	You can create one by completing the signup process at **portal.viabill.com/signup**

IMPORTANT
Always back up your WordPress site before installing new plugins. Test in a staging environment first.

2 Install the Plugin

The ViaBill plugin can be installed directly from the WordPress plugin directory.

1. Go to **Plugins** → **Add New** in your WordPress administration.
2. Search for **“ViaBill – WooCommerce”** in the search field.
3. Click **Install Now** next to the ViaBill plugin.

[Screenshot: Adding the ViaBill plugin to your WordPress site]

4 Once the installation is complete, click **Activate**.

[Screenshot: WordPress administration – activating the ViaBill plugin]

ALTERNATIVE – MANUAL INSTALLATION

Download the plugin from wordpress.org/plugins/viabill-woocommerce, then upload the ZIP file via Plugins → Add New → Upload Plugin.

3 Connect Your ViaBill Account

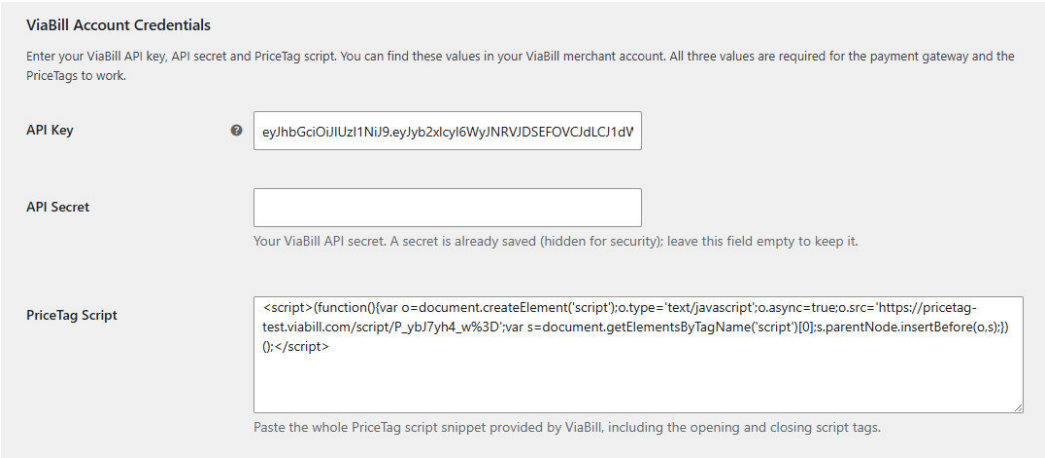

After activation, connect your ViaBill merchant account by entering your account credentials in the plugin settings.

1 Go to **WooCommerce** → **Settings** → **Payments**, find **ViaBill** in the list of payment methods, and click **Manage**.

2 Fill in the **ViaBill Account Credentials** section with the following values from your ViaBill merchant account:

- **API Key** – your ViaBill API key
- **API Secret** – your ViaBill API secret. If a secret is already saved, it is hidden for security. Leave this field empty to keep it.
- **PriceTag Script** – paste the whole PriceTag script snippet provided by ViaBill, including the opening and closing script tags.

All three values are required for the payment gateway and the PriceTags to work.

The ViaBill Account Credentials section with the API Key, API Secret and PriceTag Script fields

3 Click **Save changes** to store your credentials.

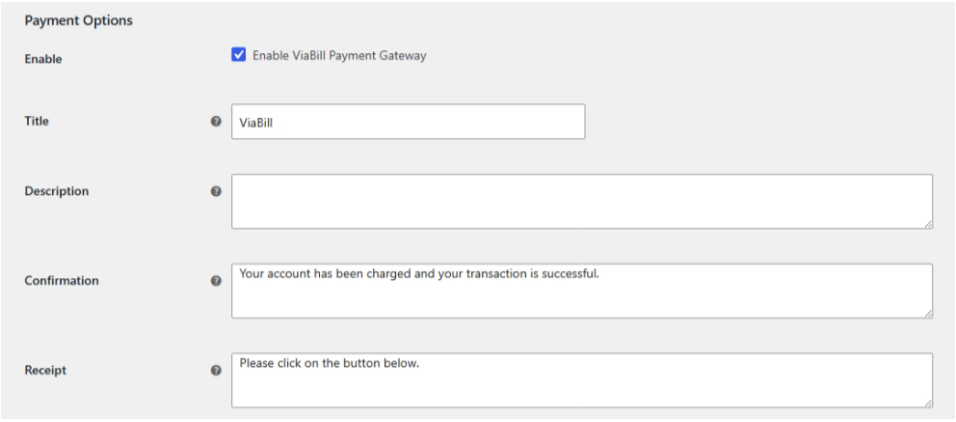

> **NEW TO VIABILL?**
> If you don't have a ViaBill account yet, create one by completing the signup process at https://portal.viabill.com/signup. Once registered, you can find all three values directly in your ViaBill merchant account.

4 Configure the Plugin

The plugin settings are found below the account credentials on the same page (**WooCommerce** → **Settings** → **Payments** → **ViaBill** → **Manage**). They are grouped into **Payment Options** and **Advanced options**.

Payment Options

Setting	Recommended	Description
Enable	Yes	Enables ViaBill as a payment method ("Enable ViaBill Payment Gateway").
Title	–	The payment method title shown to customers during checkout.
Description	–	The payment method description (optional).
Confirmation	–	The message shown after the account has been charged and the transaction is successful.
Receipt	–	The message shown on the receipt page.

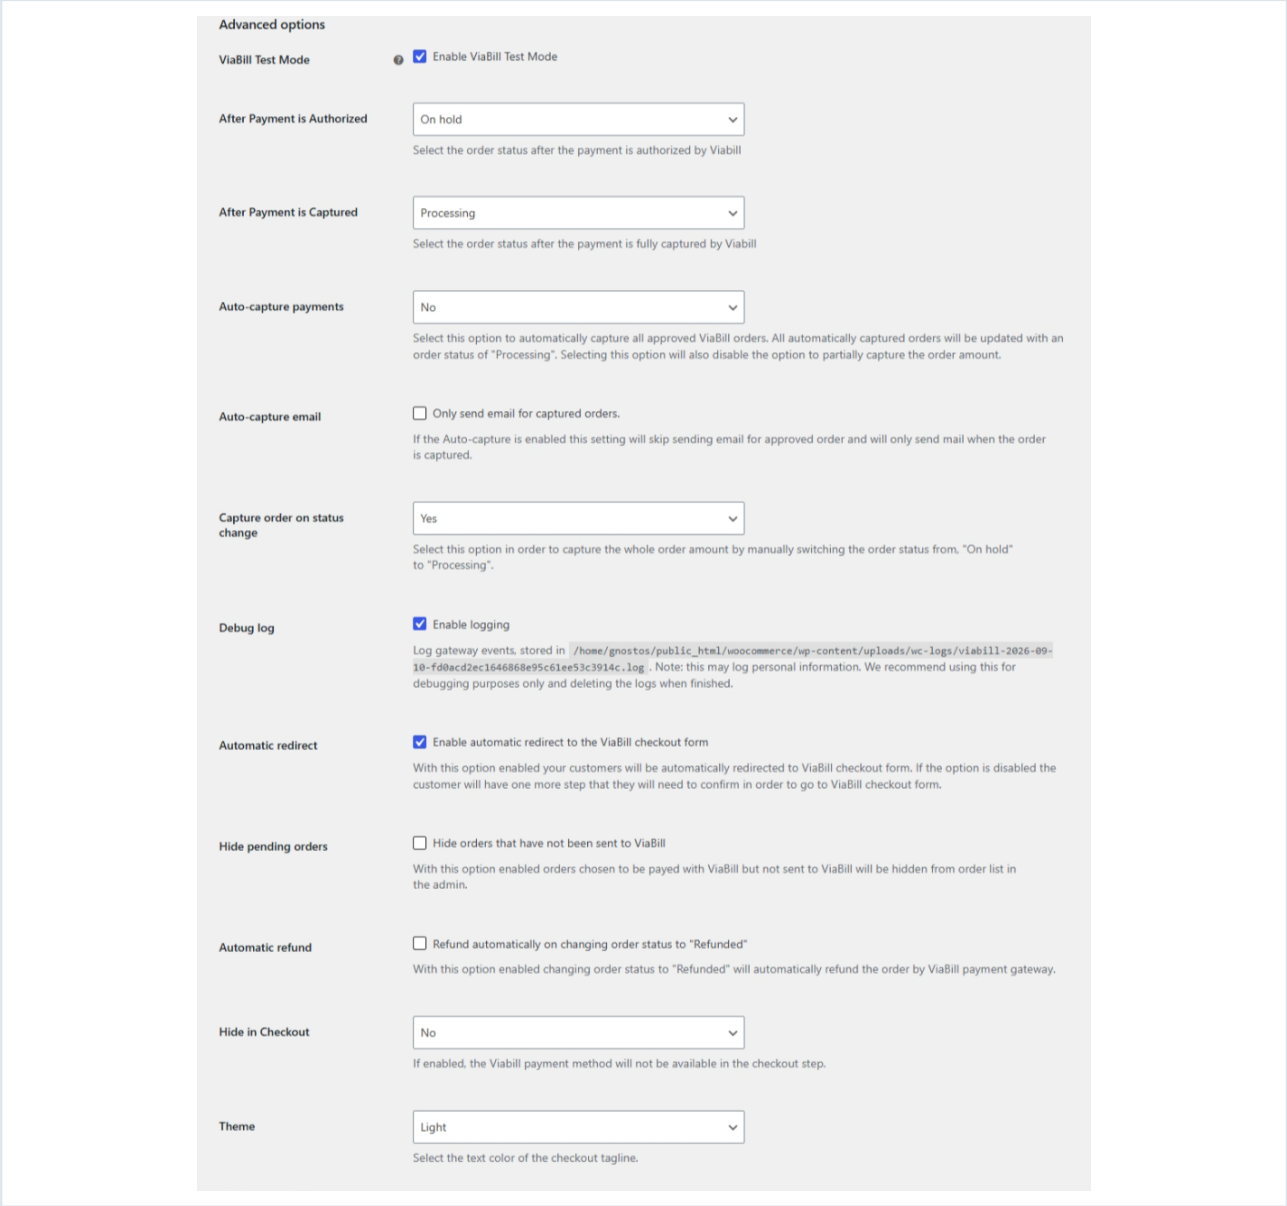

The Payment Options settings

Advanced options

Setting	Description
ViaBill Test Mode	Enable it after the installation to verify that the plugin is properly installed and configured.* While in test mode, a notice reminds you that ViaBill is in sandbox/test mode; disable it for live web shops.

Setting	Description
After Payment is Authorized	Select the order status after the payment is authorized by ViaBill (e.g. “On hold”).
After Payment is Captured	Select the order status after the payment is fully captured by ViaBill (e.g. “Processing”).
Auto-capture payments	Automatically capture all approved ViaBill orders. All automatically captured orders will be updated with an order status of “Processing”. Selecting this option will also disable the option to partially capture the order amount.
Auto-capture email	Only send email for captured orders. If Auto-capture is enabled, this setting will skip sending email for approved orders and will only send mail when the order is captured.
Capture order on status change	Capture the whole order amount by manually switching the order status from “On hold” to “Processing”.
Debug log	Log gateway events to a file under wp-content/uploads/wc-logs/. Note: this may log personal information; we recommend using this for debugging purposes only and deleting the logs when finished.
Automatic redirect	Automatically redirect your customers to the ViaBill checkout form. If the option is disabled, the customer will have one more step to confirm before going to the ViaBill checkout form.
Hide pending orders	Orders chosen to be paid with ViaBill but not yet sent to ViaBill will be hidden from the order list in the admin.
Automatic refund	Changing the order status to “Refunded” will automatically refund the order by the ViaBill payment gateway.
Hide in Checkout	If enabled, the ViaBill payment method will not be available in the checkout step.
Theme	Select the text color of the checkout tagline (Light/Dark).

* Start with Test Mode = Yes to verify everything works, then switch to No for live transactions.

The Advanced options settings

DATABASE UPDATE

If you updated the ViaBill plugin from before version 1.1.0 to a later version, we strongly advise you to start a database update to ensure that there are no order conflicts. Performing a database update will only update ViaBill related data in the database; no other data will be accessed or altered. Before starting the update we recommend you create a backup of your database.

Click **Save changes** after configuring the settings.

5 ViaBill PriceTags

The PriceTag is a key conversion tool. It shows customers their estimated monthly payment directly on product pages, cart, and checkout – before they even select ViaBill as a payment method.

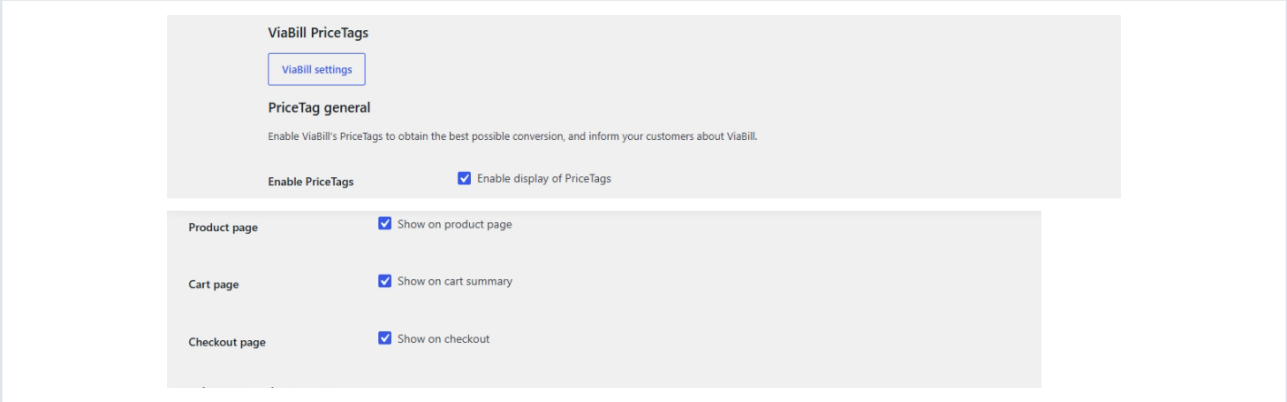

Benefits of enabling PriceTag:

- Increases average order value by making larger purchases feel affordable
- Improves conversion rate by removing price-related purchase hesitation
- Automatically calculates and displays the monthly installment amount
- Updates dynamically based on the product price or cart total

The PriceTag settings have their own tab: go to **WooCommerce** → **Settings** → **ViaBill PriceTags** (or use the **ViaBill PriceTags** button at the top of the payment gateway settings).

PriceTag general

Setting	Recommended	Description
Enable PriceTags	Yes (checked)	Enable the display of PriceTags to obtain the best possible conversion, and inform your customers about ViaBill.
Product page	Yes (checked)	Show the ViaBill PriceTag on single product pages.
Cart page	Yes (checked)	Show the ViaBill PriceTag on the cart summary.
Checkout page	Yes (checked)	Show the ViaBill PriceTag on checkout.

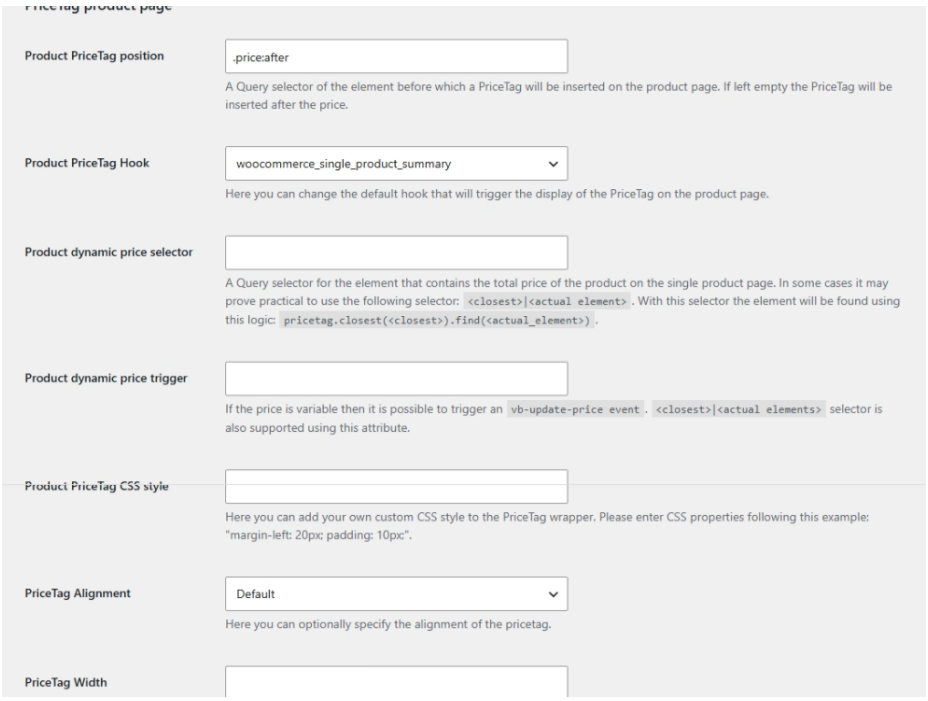

The PriceTag general settings with the display locations

PriceTag product page

These settings control how and where the PriceTag appears on individual product pages:

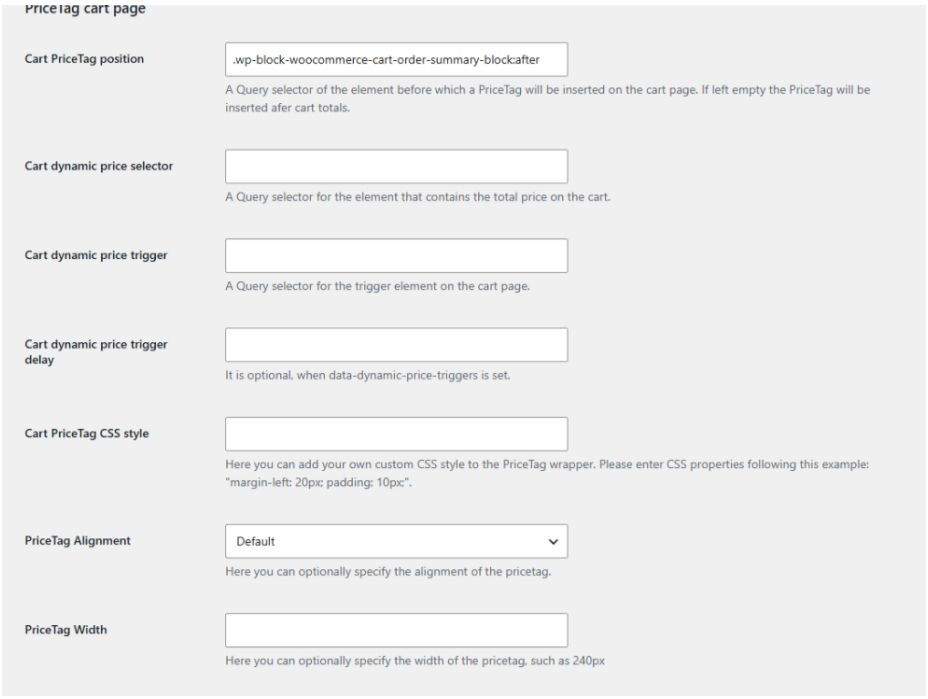

- **Product PriceTag position** – a query selector of the element before which a PriceTag will be inserted on the product page (e.g. **.price:after**). If left empty, the PriceTag will be inserted after the price.
- **Product PriceTag Hook** – change the default WordPress hook that triggers the display of the PriceTag on the product page (default: **woocommerce_single_product_summary**).
- **Product dynamic price selector** – a query selector for the element that contains the total price of the product on the single product page. In some cases it may prove practical to use a <closest>|<actual element> selector.
- **Product dynamic price trigger** – if the price is variable, it is possible to trigger a vb-update-price event; a <closest>|<actual elements> selector is also supported.
- **Product PriceTag CSS style** – add your own custom CSS style to the PriceTag wrapper (e.g. “margin-left: 20px; padding: 10px;”).
- **PriceTag Alignment** and **PriceTag Width** – optionally specify the alignment and the width of the PriceTag, such as 240px.

The PriceTag product page settings

PriceTag cart page

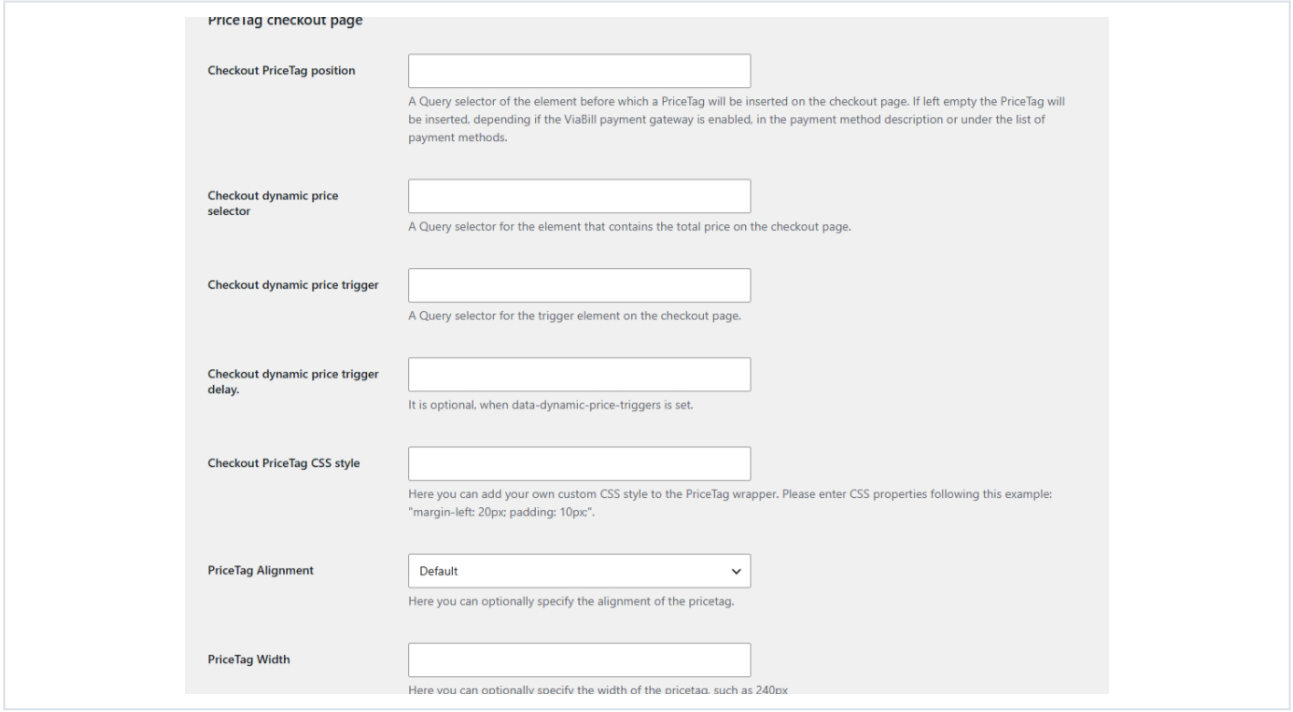

These options work similarly to the product page settings but apply to the cart summary: **Cart PriceTag position** (a query selector of the element before which the PriceTag will be inserted – if left empty, it is inserted after cart totals), **Cart dynamic price selector**, **Cart dynamic price trigger** and its optional **trigger delay**, **Cart PriceTag CSS style**, **PriceTag Alignment** and **PriceTag Width**.

The PriceTag cart page settings

PriceTag checkout page

For the checkout page you can specify the **Checkout PriceTag position** – if left empty, the PriceTag will be inserted, depending if the ViaBill payment gateway is enabled, in the payment method description or under the list of payment methods – along with the **Checkout dynamic price selector**, **trigger** and **trigger delay**, **Checkout PriceTag CSS style**, **PriceTag Alignment** and **PriceTag Width**.

The PriceTag checkout page settings

Click **Save changes** after configuring the PriceTag settings.

6 Verify the Installation

Confirm that ViaBill is working correctly in your store.

1. Open your webshop and go to a product page. Confirm the **ViaBill PriceTag** is visible below the price.

[Screenshot: Product page with the ViaBill PriceTag]

2. Add a product to the cart, and verify the PriceTag is shown on the **cart page**.

[Screenshot: Cart page with the ViaBill PriceTag]

3. Proceed to checkout, and confirm **ViaBill** is listed among the payment methods.

4. Place a test order (with Test Mode enabled) to confirm the whole flow.

5 Check **WooCommerce** → **Orders** to verify the order status shows “Approved by ViaBill”.

[Screenshot: WooCommerce Orders – order approved by ViaBill]

7 Order Management

ViaBill orders can be captured and refunded directly from your WooCommerce administration.

Capturing orders

When you have received a ViaBill order, open the order and click **Capture**. Enter the amount and confirm. The status changes to “Captured with ViaBill”.

Refunding orders

The order must be captured before it can be refunded. Open the order, click **Refund**, enter the amount, and confirm.

IMPORTANT

You must capture orders within 7 days. If you don't, ViaBill cannot collect the amount and you will not receive the payout.

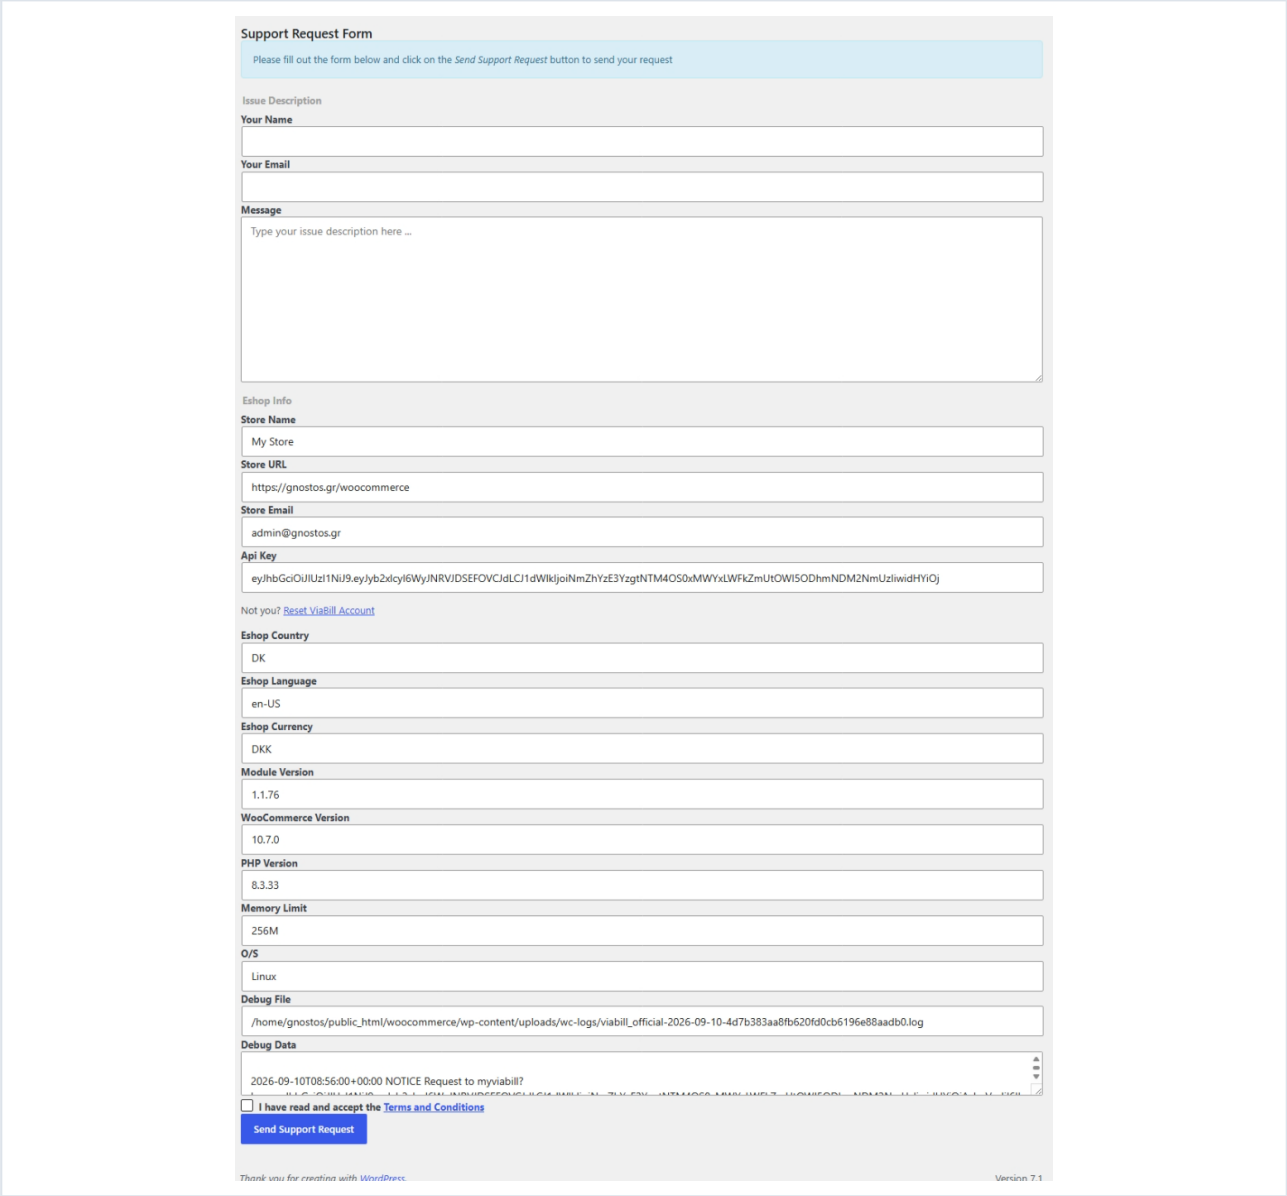

Troubleshooting & Support

Issue	Solution
Plugin not showing under Payments	Go to Plugins and verify ViaBill is activated. Then check WooCommerce → Settings → Payments.
Checkout shows an error	Make sure SSL is active on your website. Verify the WooCommerce version is 3.3+.
PriceTag not showing	Verify PriceTag is enabled in the ViaBill settings. Clear WordPress and browser caches. Check for conflicts with the theme or other plugins.
Orders not being captured	Make sure Test Mode is turned off. Enable the debug log and check WooCommerce → Status → Logs for details about the error.
Conflict with other plugins	Temporarily deactivate other payment plugins to narrow down the problem. Contact teknik@viabill.com with the debug log.

Built-in support request form

The plugin includes a built-in **ViaBill Support** page, available in the WordPress admin menu under WooCommerce. Fill out the **Support Request Form** with your name, email and a description of the issue, and click **Send Support Request**. The form automatically attaches your shop information (store name, URL, country, language, currency, plugin and WooCommerce versions, PHP version and more) together with the

debug data, so the ViaBill support team has everything needed to investigate.

The built-in Support Request Form on the ViaBill Support page

NEED HELP?

Contact ViaBill technical support at **teknik@viabill.com**. This guide covers the ViaBill plugin for WooCommerce v1.1.76. You can find the latest version in the WordPress plugin directory.
